AutoCAD originally ran on the Apple II family of computers, with the first release of AutoCAD for the Apple II running in December 1982. In 1987, AutoCAD was ported to the Commodore 64. In 1992, the first version of AutoCAD for Windows was released. The software was upgraded in 1994 to include mouse support. In 1995, AutoCAD Extended Edition was released to include Graphical User Interface (GUI) changes. AutoCAD 2000 was released in 1997, with solid modeling features and extended vector editing.[1] The latest version of AutoCAD is AutoCAD 2017. In 2006, Autodesk announced the AutoCAD R14 release cycle, which increased development productivity and consistency. However, the company also launched the revised software and hardware development platform, and integrated the design and engineering collaboration platform, Fusion 360. Autodesk Fusion 360 was the first of these cross-platform collaboration tools that brought together design and engineering; today it is used as a common platform for 3D modeling, visualization and BIM coordination.[2] In 2017, Autodesk launched AutoCAD 2017, which included a new version of the company's multitouch pen-based tablet and an entirely new user interface that was designed to make the software faster and easier to use.[3] AutoCAD 2017 is the first version of AutoCAD to work natively with Windows 10.

Functionality AutoCAD is used for conceptual design, mechanical engineering, architectural and landscape modeling, drafting, and presentation of results. It can also be used for technical documentation and archiving. AutoCAD can also be used for other types of drawings and data. AutoCAD enables users to interact with their data and manipulate it in a variety of ways. Users can select, rotate, scale, and transform objects, and create sub-objects using certain properties. They can draw lines, arcs, circles, ellipses, splines, spline loops, solids, surfaces, and text. They can import, export, and publish documents, or edit them directly. They can also apply tools to manipulate them further. There are many other features, such as visual styles, tag tools, archiving, optimization,

Q: Javascript: How to remove rows when its cell is greater than 100? I have a table and in every row I have a column containing some values. One of the cell contains percentage that should be rounded and converted into integer value (for example: 100%. I'm not able to use anything like this: `.each(function(){ if(this.value > 100){ this.value = 0; } });`); A: The problem is that you're assigning `this.value = 0`, when you should be removing the row. You can use `document.getElementById('table').rows[0].remove();` to remove the first row of a table. If you wanted to leave the table in tact, but remove all rows with a value of more than 100, you could do something like this: `var rows = document.getElementById('table').rows; for (var i = 0, length = rows.length; i < length; i++) { if (rows[i].value > 100) { rows[i].remove(); } }`
