QuickMon is a monitoring tool that can check various system resources and issue alerts when specific thresholds are overridden. Collecting the information The application uses collectors, small tools called agents that retrieve data from various parts of the system, which can be grouped into folders, according to their purpose. They are available in the main screen, which has been drawn with the modern standards in mind, at the same time considering ease of use and quick access to the items listed.

QuickMon sports a large amount of collectors neatly organized according to the data they are intended to monitor. Those that can come in handy even for the regular users include gathering details from Windows event logs, the Performance counter and the state of Windows services. The program is more comprehensive than this and makes available collectors for other types of jobs that can relate on SQL databases, database servers or SOAP web service query. Receiving alerts Once a collector has been properly set up, there is the possibility to establish thresholds that trigger alerts. These can repeat with a certain frequency and if the error or warning values persist. The application is versatile and also provides the means to run scripts that can correct the problem automatically depending on the type of alert (warning or error). What users say about QuickMon: "Finally a good monitoring tool. I have been looking for a while for one that does all that I need. I had a basic script that i made myself but this tool is very intuitive and easy to use." "I have been looking for a couple of months for a good monitoring tool that offers a lot of functionality and can go through the computer and see what is going on, how my load is going, what the windows services are doing, check memory and etc. I have found my monitoring tool! it's called quickmon!" "For a short time now I have been researching for a good windows tool to monitor my servers. After searching for a while I found QuickMon and it's amazing! I will probably invest more time in learning the features of this program but I must say that I am already very satisfied with the functionality of this program."Corticosteroids in the treatment of mastocytosis. AgiMonitor is a monitoring solution with reports for server, network, security, app and database monitoring, with one of the most useful user interface for any monitoring experience. Monitors Information Sources The monitoring system performs continuously checks of many different system resources: performance counters, security, firewall, processes, logs, email, network, databases and applications. The application can run as a Windows service, can be monitored remotely and can report in a web form or in a T-SQL query that can generate T-SQL queries and/or can send emails. AgiMonitor uses collected information for: Monitoring the status of the monitored systems Reporting the alarms and the quality of service Following all the conditions of the monitored systems Implementing actions for solving the problems Using a clear and easy to understand UI Searching the information in the various data sources ...and many more All these characteristics are provided through a clean and simple graphical interface, which can also be used by the less skilled user. Information Sources The monitoring system supports thousands of information sources, out of which more than 1500 are included in the application. Depending on the information source monitored, the program can: Send emails automatically or manually Generate T-SQL queries for the data and be connected to the SQL databases in which the information is stored Perform a web query of the data and post the result on a website Organize data in the various folders of the information sources Requirements Windows Microsoft.NET Framework 4.0 or later SQL Server 2005 or later Visual C++ Registering and using the application In order to use AgiMonitor correctly, you need to register and provide the credentials to log in to the application. The registration takes place with a simple wizard and is required to obtain an activation key. The same process is also required to obtain the administrator credentials, in order to administer the monitor from the web interface. Once registration is complete, the program will start automatically and will prompt to the URL address of the web interface. In the web interface, you can change the password, search the information sources, filter the information and send an email to the administrator of the system. If necessary, you can use the explorer (Windows XP) to visit the data stored in the information sources, and to manage the data stored in them

A program for creating and running scripts for monitoring hosts and generating alerts about potential attacks. It uses the standard Windows script language - it is not an interactive tool. Instead of typing commands and waiting for their execution, you write scripts that perform the necessary actions. The scripts are saved in a special directory, where the server is monitored and where alerts are generated if necessary. In the Alerting Mechanism, the scripts act as agents - they check the monitored host and detect conditions for generating alerts
